

Response to Code Review Findings - ANNOTATED / VERIFIED

Developer's response text shown in black. Reviewer verification added in RED, checked line-by-line against the actual code in the two branches the developer pushed on 2026-06-29:

- main (Android) = commit 64565f0, pushed 2026-06-29 16:49
- Symospace_IOS_V0.1 (iOS) = commit 2b6c093, pushed 2026-06-29 16:58 (newest build)

OVERALL RESULT: 7 of 8 items confirmed fixed. 1 security item is NOT fixed on the newest (iOS) branch.

Good

WHAT IS STILL MISSING - with exact file/line examples:

1) iOS

Item-by-item verification

Issue #1: Security Logging / Debug Wrapper

Developer: The authentication debug logs were temporary. During initial cleanup they were commented out. Based on the review, all remaining authentication and development-only logs have now been completely removed instead of left as comments. I also completed a final review to ensure production builds no longer include unnecessary authentication or user-related debug logs.

[PARTIALLY CONFIRMED - NOT DONE on iOS]

branch

Issue #2: GC / Allocation Optimization in Hand Tracking

Developer: The audit correctly identified that the memory optimization applied to the ring tracking had not been added to the watch/wrist implementation. This has now been updated - the same zero-allocation optimization is applied to both, including HandTrackingVisualizer, where the per-frame buffer.ToArray() previously existed.

[CONFIRMED - DONE]

per-fra

Issue #3: Duplicate ErrorResponse Classes

Developer: The report correctly identified multiple ErrorResponse definitions. During initial cleanup only some were removed. I have now removed all remaining duplicates; the project uses a single shared ErrorResponse class across all services and screens.

[CONFIRMED on main / INCOMPLETE on iOS]

main
Faceb

Issue #4: Per-frame Logging in BodySpawned Script

Developer: The audit flagged a BodySpawned script with a debug log that could affect performance. I confirmed it was not referenced in any active scene; it only had an empty Update() and one debug log. Since it was unused, the script has been removed.

[CONFIRMED - DONE]

Verifie
so ren

Issue #5: Missing AR Scenes in Build Settings

Developer: The missing scenes relate to AR hand tracking and body tracking, available only in the iOS version. The reviewed repo was the Android branch, which intentionally omits the iOS-specific AR scenes. I created a dedicated iOS branch that includes the Hand Tracking scene, Body Tracking scene, and ARKit / iOS-specific workflows.

[CONFIRMED - DONE / explanation valid]

scene

Issue #6: Apple Sign-In Wiring

Developer: The SignInWithApple typo was already corrected to SignInWithApple. Apple Sign-In is implemented only for iOS and is not in the Android branch, so the UI flow and serialized button bindings are not expected in the Android scenes. The dedicated iOS branch contains the Apple Sign-In implementation.

[CONFIRMED - DONE]

Issue #7: Category Parsing Edge Case

Developer: The audit found an edge case where an invalid parse could still overwrite the selected category. The logic now changes the category only when parsing is successful, preventing invalid input from replacing the current selection.

[CONFIRMED - DONE]

Verifie
uncon

Issue #8: Repository Cleanup

Developer: The report identified Unity recovery files and temporary scene files committed to the repo. I confirmed these were editor-generated and not part of the project. They have now been removed.

[CONFIRMED - DONE]
